OVERVIEW

WOLF's versatile Video Processing Unit (VPU) board includes both an advanced NVIDIA Quadro Pascal GPU and WOLF's Frame Grabber eXtreme (FGX). This board accepts up to eight simultaneous 3G-SDI inputs and CVBS/STANAG inputs. The video data can be routed to the powerful Pascal GPU for processing or encoding, and then output in several formats, including up to eight 3G-SDI, CVBS/STANAG, and optional output to DisplayPort, HDMI or DVI.

The WOLF Frame Grabber eXtreme (FGX) is the engine that provides the board with conversion of video data from one standard to another, with a wide array of video input and output options for both cutting-edge digital I/O and legacy analog I/O. The FGX has direct memory access (DMA) to the Quadro Pascal's GPU memory for GPU processing and complex analysis. By including both the versatile FGX and a high performance Quadro Pascal GPU on one board WOLF's I/O and processing solution avoids the SBC data rebroadcast traffic jams that commonly occur with a 2-board solution.

NVIDIA QUADRO PASCAL P5000

Quadro Pascal P5000 is an enormous leap in processing capability compared to the previous generation Maxwell M5000SE. It can provide up to 6.2 TFLOPS of CUDA processing at a very modest operating power, providing a huge improvement to 62 GFLOPS/Watt, making it an excellent choice for aerospace and defense applications.

Quadro Pascal architecture provides a more powerful Unified Memory feature. Pascal's larger virtual memory address space enable GPUs to access the entire system memory plus the memory of all GPUs in the system, while the on-demand page migration engine allows the system to migrate pages from anywhere in the system to the GPU's memory for processing. This improved memory handling results in significantly improved algorithm efficiency.
